Allergen Component Comments

Comment	Note	

CAT IGE ASSESSMENT		
Cat dander IgE >0.34 kU/L triggered the performance of cat component testing. IgE to the lipocalin Fel d 4 was detected.		
-		
Fel d 4 is a lipocalin and the second most frequent IgE sensitizing component of cat dander. Many Fel d 4 positive patients also test positive for other, cross-reactive

TESTS	RESULT	FLAG	UNITS	REFERENCE	INTERVAL	LAB
components from other mammals. The occurrence of Fel d 4 sensitization without Fel d 1 sensitization suggests that cross-reactivity to another animal has caused cat extract positivity and not primary sensitization to cat. ***** HORSE IGE ASSESSMENT - Horse dander IgE >0.34 kU/L triggered the performance of horse component testing. IgE to the lipocalin Equ c 1 was detected. - Equ c 1 is a lipocalin and the most common horse allergen. Equ c 1 is structurally similar to proteins from other animals including cat, dog, rabbit, rat and mouse. Asthmatic children sensitized to Equ c 1 may have more severe symptoms. Equ c 1 (from horse) and Fel d 4 (from cat) are structurally similar lipocalins and co-sensitization to both is common. It can be difficult to discern when sensitization to both indicates clinical allergy to both cats and horses or only molecular cross-reactivity. ***** DOG IGE ASSESSMENT - Dog dander IgE >0.34 kU/L triggered the performance of dog component testing. IgE to the lipocalin Can f 1 was detected. - Can f 1, a lipocalin protein, displays some cross-reactivity with a cat component and may contribute to symptoms in both cat- and dog-allergic patients. Can f 1 IgE is superior to dog allergen extract IgE in diagnosing dog allergy. Can f 1 sensitization can serve as a prognostic marker of future dog allergy and allergic asthma. ***** MULTIPLE FURRY ANIMAL SENSITIZATION - This patient is sensitized to lipocalins from multiple species. This pattern of sensitization is associated risk for respiratory allergic disease.
